PRACTICAL TASK #03

Identify & Design an AI Automation Solution

Proposed Solution: AI Lead Qualification & Project Requirement Automation

Candidate Name	Muhammad Yasir
Internship Domain	AI Automation
Internship	AI Automation Internship
Organization	Zayan Soft Tech
Practical Task	Practical Task #03
Task Title	Identify & Design an AI Automation Solution for a Real Business
Business Selected	Star Developer (sample business for this exercise)
Proposed Solution	AI Lead Qualification & Project Requirement Automation

Innovating Digital Solutions | Empowering Digital Futures

Solution design proposal. Not a deployed system.

1. Executive Summary

IT and digital services companies receive a steady flow of project inquiries. Most arrive as short, informal messages, such as "I need an e-commerce website for my clothing business." Before a sales or project team can respond usefully, someone must work out which service is needed, collect missing requirements, judge how serious the inquiry is, record the details, and follow up. This work is repetitive and easy to delay.

This document proposes an **AI Lead Qualification & Project Requirement Automation** for **Star Developer**, the sample IT and digital services business selected for this exercise. The proposed solution reads each inquiry, identifies the requested service, extracts the available details, asks for what is missing, classifies the inquiry, prepares a structured lead record, and notifies the right team. People remain responsible for pricing, negotiation, and every complex or sensitive decision.

Solution Design Notice

This is a **proposed solution design**. Nothing described here has been built or deployed. No APIs, WhatsApp channels, n8n workflows, spreadsheets, or CRM systems are connected, and no real customer data or performance results are used. The sample customer in Section 11 is fictional.

2. Business Overview

Business Name	Star Developer
Business Type	IT Company / Digital Services Company
Main Services	Website Development, Web Application Development, Mobile Application Development, AI Solutions, AI Automation, Digital Marketing, Graphic Design, Custom Software Solutions, and IT Solutions.
Target Customers	Businesses, startups, organizations, individuals who need digital products, companies that need software solutions, and businesses interested in automation.
Role in This Document	Star Developer is the sample business selected for this practical internship exercise. No claim is made about its real internal operations, staff, customers, or systems.

3. Business Process Analysis

The table shows how a typical project inquiry could be handled manually in a company of this kind. It is an illustrative process used to find automation opportunities, not a record of Star Developer's actual workflow.

Step	Manual Activity	Where Time or Quality Is Lost
1. Read and identify	Read each message and decide which service is needed.	Messages wait until someone is free; vague wording needs interpretation.
2. Ask and collect	Write clarifying questions and gather the answers.	The same questions are typed repeatedly; details are scattered in long chats.
3. Judge lead quality	Decide if the person is a serious potential customer.	Judgment can differ between people.
4. Record and forward	Copy details into a sheet or CRM and inform the team.	Manual data entry, possible errors, and delayed handover.
5. Follow up	Remember to contact the lead later.	Missed or late follow-ups.

4. Identified Business Problem

Selected problem: AI-Powered Lead Qualification & Project Requirement Collection.

An initial inquiry such as "I need an e-commerce website for my clothing business" tells the team what the customer wants, but not the details needed to plan the work: the number of products, payment methods, delivery needs, existing domain or hosting, and extra features. Collecting these details by hand for every inquiry is repetitive, and the cost grows with the number of inquiries.

Scenario, Not a Verified Fact

The problem is presented as a realistic business-process scenario for designing a solution. It is not a claim that Star Developer currently faces these problems or has any existing automation.

5. Why the Problem Needs Automation

Customer messages are written in natural language, and every customer words things differently. Fixed-rule automation struggles with this. AI can read varied messages, identify the service, extract details, and write suitable follow-up questions, which makes it a strong fit for this process.

Factor	Why It Suits Automation
Repetitive inquiries	Many inquiries ask about the same few services.
Similar questions	The same clarifying questions are needed for each service type.
Repeated requirement collection	Collecting requirements follows a predictable pattern.
Manual data entry	Details are retyped into sheets or a CRM.
Lead qualification	Clear signals of intent can be recognized consistently.
Information extraction	Names, services, and features can be pulled out of free text.
Follow-up management	Reminders and notifications are easy to forget by hand.
Staff time on initial tasks	Employees spend time on first steps instead of project discussions.
Inconsistent handling	A standard workflow gives every inquiry the same treatment.
Delayed responses	Automation can send an acknowledgement and questions immediately.

6. Proposed AI Automation Solution

Proposed name: AI Lead Qualification & Project Requirement Automation. From a business perspective, the solution acts as a first-line assistant that prepares every inquiry for a human team. Conceptually, it would perform twelve functions:

#	Function	#	Function
1	Receive a customer inquiry	7	Classify the inquiry
2	Read and understand the message	8	Determine potential lead status
3	Identify the requested service	9	Create a structured lead record
4	Extract available project information	10	Prepare information for the right team
5	Identify missing information	11	Recommend human follow-up when necessary
6	Ask relevant follow-up questions	12	Keep a clear record of the inquiry

This is a designed solution. It is not a deployed system.

7. Customer Journey

The proposed journey from the customer's point of view is shown below. Every stage is described in plain language.

Stage	What Happens
1. Customer submits inquiry	The customer sends a message through WhatsApp or website chat.
2. AI receives message	The automation passes the message to the AI.
3. AI understands request	The AI works out what the customer is asking for.
4. Service identified	The AI decides which Star Developer service is needed.
5. Requirements extracted	Details already given, such as business type and features, are captured.
6. Missing information found	The AI compares what it has with what the team needs.
7. Follow-up questions asked	The AI sends short, clear questions for the missing details.
8. Lead qualified	The AI judges how likely it is that the inquiry is a real project.
9. Lead record prepared	The details are organized into a structured record.
10. Team notified	Sales or the project team receives a summary.
11. Human follow-up	A team member contacts the customer.
12. Project discussion	The customer and team discuss scope, pricing, and next steps.

8. Automation Workflow

The workflow follows the required structure: **Customer/Input → AI Processing → Automation → Action → Final Result.**

Stage	Proposed Behavior
Customer / Input	The customer sends a project inquiry.
AI Processing	The AI reads the inquiry and identifies the service needed (website, web application, mobile application, AI solution, AI automation, digital marketing, or another IT service). It extracts the customer name, business type, project type, main requirements, expected features, and contact information if voluntarily provided. It then detects what is missing and writes suitable follow-up questions.
Lead Qualification	The inquiry is classified as General, Service, Potential Lead, Complex, or Human Escalation Required.
Automation	Structured information is prepared for storage in Google Sheets, a CRM, or a lead database, depending on the final implementation choice.
Action	The sales or project team receives the relevant lead information.
Final Result	The human team follows up with an organized, better-qualified potential customer.

9. Workflow Diagram

The diagram shows the proposed flow, including the missing-information decision and the escalation route for complex or uncertain cases.

10. AI Decision & Lead Qualification Logic

The AI would sort each inquiry into one of four categories. The category decides what the automation does next.

Category	When It Applies	Proposed Action
1. General Inquiry	The customer asks a basic question.	The AI provides suitable information from approved business details.
2. Service Inquiry	The customer is interested in a service.	The AI collects initial requirements and asks follow-up questions.
3. Potential Lead	The customer shows clear project intent.	The AI prepares a lead record and recommends human follow-up.
4. Complex / Uncertain Case	The AI cannot confidently handle the request.	The inquiry is escalated to a human. The AI does not guess.

Responsible AI Rule

When confidence is low, the AI must not invent an answer, a price, or a promise. It tells the customer that a team member will help, and the case is escalated.

11. Sample Customer Scenario

The following is a **fictional demonstration** for this document. It is not a real customer.

Customer Message	"Hi, I own a clothing business and I want an e-commerce website. I need product listings, online payments, and order management. Can someone help me?"
AI Understanding	Requested service: E-commerce website (Website Development).
Extracted Requirements	Clothing business; e-commerce website; product listings; online payments; order management.
Missing Information	Number of products; preferred payment methods; delivery requirements; existing domain or hosting; additional features; contact details.
AI Follow-Up (Proposed)	1. Roughly how many products do you plan to list? 2. Which payment methods would you like to offer? 3. Do you need delivery or courier options in the store? 4. Do you already have a domain name or hosting? 5. Are there any other features you would like, such as discounts or customer accounts? 6. What is the best way for our team to contact you?
Lead Status	Potential Lead
Next Action	Prepare a structured lead record and notify the sales or project team for human follow-up. Exact pricing and project scope are discussed by the team.

12. Proposed Lead Record Structure

The table shows a **proposed** lead record. It is a design suggestion and is not implemented. Sample values come from the fictional scenario in Section 11.

Field	Sample Value (Fictional)	Field	Sample Value (Fictional)
Lead Name	Not provided yet	Lead Status	Potential Lead
Contact Information	Requested from customer	Priority	Set by rules or the team
Business Type	Clothing business	Source	WhatsApp or website chat
Requested Service	Website Development	Follow-Up Status	Pending
Project Type	E-commerce website	Human Assigned	To be assigned
Requirements	Product listings, online payments, order management	Notes	Awaiting answers to follow-up questions
Missing Information	Product count, payment methods, delivery, hosting, extra features		

13. Tools & Technologies

The tools below are **recommendations for a future implementation**. None of them is connected or running at this stage.

Layer	Recommended Technology	Notes
AI Layer	OpenAI / ChatGPT	Message understanding and extraction.
Automation Layer	n8n	Make or Zapier could be alternatives.
Communication Layer	WhatsApp Business / API or Website Chat	Proposed integration only.
Data Layer	Google Sheets or a CRM	Chosen with the client.
Notification Layer	Email, CRM, or team notification	Alerts the responsible team.

14. Role of Each Technology

Tool	Layer	Proposed Role
OpenAI / ChatGPT	AI	Understand and process customer messages, extract requirements, classify inquiries, and assist in lead qualification.
n8n	Automation	Connect services and automate workflow steps in the correct order.
WhatsApp / API or Website Chat	Communication	Receive customer messages and send follow-up questions.
Google Sheets / CRM	Data	Store lead information and track lead status.
Email / CRM Notification	Notification	Alert the responsible team when a qualified lead needs attention.

15. Human Oversight & Escalation

Human judgment remains essential. The following cases should be passed to a team member:

Case	Why a Person Is Needed
Exact project pricing	Prices depend on a full evaluation by the team.
Contracts and legal matters	These carry legal and financial responsibility.
Complex technical requirements	Experts must assess feasibility and design.
Negotiations	They need human judgment and relationship skills.
Complaints	Customers need empathy and a real solution.
Sensitive information	It requires careful, secure handling.
High-value projects	They deserve personal attention.
Low-confidence AI outputs	The AI should not guess.
Unusual customer requirements	They fall outside standard rules.

Principle

AI assists the team; it does not replace professional human judgment.

16. Business Benefits

Benefit	How the Proposed Automation Helps
Saves employee time	Reduces repetitive handling of initial inquiries.
Faster response	Customers can receive quick initial assistance.
Better lead management	Potential leads are structured and organized.
Less manual data entry	Information can be extracted automatically.
Improved customer experience	Customers get a more organized first interaction.
Better follow-up	Qualified leads are forwarded to the right team.
Reduced human error	Structured collection reduces repetitive data-entry mistakes.
Scalability	The workflow can support a growing volume of inquiries.

These are expected qualitative benefits of the design. No numerical improvements are claimed, because no measurements exist.

17. Business Value

Why would a business pay for this automation? From a business owner's point of view, the value is in making the first stage of every project inquiry faster, more consistent, and less dependent on staff availability:

- **Time saved and productivity:** staff stop typing the same clarifying questions and spend more time on project discussions.
- **Faster lead handling:** inquiries are acknowledged and organized right away.
- **Better organization and less repetitive work:** every lead is stored with the same fields, and data entry and forwarding are handled by the workflow.
- **Improved customer experience:** customers receive clear, relevant questions instead of waiting.
- **Consistent processing and better follow-up:** every inquiry follows the same rules, and qualified leads reach the team with context.

18. Implementation Approach by Zayan Soft Tech

This is a **proposed roadmap** for how Zayan Soft Tech could deliver the solution as a client project. It has not been carried out for Star Developer or any other client.

Phase	Proposed Activities
1. Business Discovery	Meet the client to understand the current inquiry process, channels, lead qualification, existing tools, data needs, and team responsibilities.
2. Solution Design	Define AI responsibilities, triggers, workflow logic, lead fields, escalation rules, and data storage.
3. Tool Selection	Choose suitable technologies, such as OpenAI, n8n, WhatsApp/API, Google Sheets or a CRM, and email notifications.
4. Workflow Development	Build the automation workflow.
5. AI Prompt & Logic Configuration	Configure AI instructions, classification, information extraction, follow-up questions, and escalation rules.
6. Integration	Connect the communication and data systems.
7. Testing	Test general inquiries, service inquiries, potential leads, missing information, complex questions, and human escalation.
8. Deployment	Launch after successful testing and client approval.
9. Monitoring & Improvement	Monitor performance and refine prompts and rules based on real usage.

19. Risks & Considerations

Risk or Consideration	Proposed Response
AI may misunderstand unclear messages	Ask clarifying questions and escalate when confidence is low.
AI must not invent pricing or guarantees	Restrict answers to approved information and send pricing to the team.
Sensitive cases need review	Define clear human-review rules.
Customer data must be handled securely	Apply the practices in Section 20.
API and integration costs may apply	Estimate usage and plan the budget before building.
Workflow reliability must be tested	Test normal and unusual cases before launch.
Human escalation must always be available	Give customers an easy way to reach a person.
Business rules must be configured first	Set services, escalation rules, and lead criteria with the client.

19.1 Cost and Complexity

No prices are stated, because costs depend on the final design. Factors include the number of integrations, message volume, AI usage, CRM requirements, WhatsApp/API requirements, workflow complexity, hosting, monitoring, and maintenance.

20. Data Privacy Considerations

A real implementation should consider the following. These are design considerations and not legal advice.

Consideration	Meaning
Customer consent	Customers should know how their messages and details will be used.
Secure data storage	Lead data should be stored in protected systems.
Access control	Only authorized team members should see lead data.
Data minimization	Collect only the information that is needed.
Retention policies	Decide how long data is kept and when it is removed.
Secure API credentials	Keep keys and passwords out of shared files and messages.
Protection of contact information	Treat phone numbers and emails as sensitive.

21. Before vs Proposed Automation

Process	Traditional Manual Approach	Proposed Automation
Inquiry reading	Employee reads each message manually.	AI assists in understanding the message.
Requirement collection	Employee writes questions each time.	AI prepares follow-up questions.
Lead qualification	Manual judgment.	AI-assisted classification, reviewed by people.
Data entry	Details are typed in manually.	Structured record prepared automatically.
Team notification	Manual forwarding.	Automated notification.
Follow-up	Manual tracking.	Workflow support for follow-up status.

21.1 End-to-End Solution Summary

Result: an organized lead, a faster response, and a better business process.

22. Conclusion

This document identified a realistic business-process problem for an IT and digital services company: handling early-stage project inquiries by hand. It analyzed the manual process, explained why it suits automation, and designed a practical solution that reads inquiries, collects missing requirements, qualifies leads, prepares structured records, and notifies the team.

The design is realistic because it keeps people in charge of pricing, contracts, negotiation, and sensitive cases, and because it recommends tools and an implementation roadmap without claiming that anything has been built. The value comes from solving a genuine business problem with a clear workflow, not from using AI for its own sake.

23. Key Takeaways

1	Start with the business problem: early-stage project inquiries are repetitive and time-consuming.
2	AI suits this process because customer messages are written in varied natural language.
3	The proposed solution reads, extracts, asks for missing details, classifies, records, and notifies.
4	Four categories (general, service, potential lead, complex) decide what happens next.
5	Humans stay in control of pricing, contracts, negotiation, and sensitive cases.
6	Recommended tools: OpenAI / ChatGPT, n8n, WhatsApp or website chat, Google Sheets or a CRM, and email or CRM notifications.
7	A structured lead record keeps every potential customer organized and easy to follow up.
8	Business value comes from time saved, faster lead handling, consistency, and better follow-up.
9	Risks and privacy need planning: accuracy, security, consent, and reliability testing.
10	This is a solution design , not a deployed system, and no real data or results are claimed.
